Types of centrality measure

- **Non-spectral**
 - Degree
 - Closeness and harmonic closeness
 - Betweenness
- Spectral
 - HITS
 - PageRank

Is u a well-connected person?

- Degree: u has many connections
- **Closeness:** u is close to many people
 - Average distance from u is small
- **Betweenness:** many connections pass through u
 - Large number of shortest paths pass through u
- PageRank: u is connected to the well-connected

Closeness

Closeness

- Distance between two nodes is $d(u, v)$
- Closeness** is the reciprocal of the sum of distances

$$\text{closeness}(u) = \frac{1}{\sum_{v \in V, v \neq u} d(u, v)}$$

- Some graphs are not connected, in that case $d(u, v)$ can be ∞ ; assuming $1/\infty = 0$ one can define the **harmonic closeness**:

$$\text{hcloseness}(u) = \sum_{v \neq u} \frac{1}{d(u, v)}$$

Exercise

Compute closeness and harmonic closeness for all the nodes; $d(u,v) = 1$ if v is a neighbor of u

$$\text{closeness}(u) = \frac{1}{\sum_{v \in V, v \neq u} d(u, v)}$$

$$\text{hcloseness}(u) = \sum_{v \in V, v \neq u} \frac{1}{d(u, v)}$$

Summary

Things to remember

- Closeness and harmonic closeness definitions
- Try to compute them on your own on a graph
- Practice drawing examples of graphs in which a chosen node has high degree but low closeness, or viceversa
