Sampling a random node vs

sampling at random one of the two nodes attached to a random edge

Exercise

Numerical calculation of friendship paradox

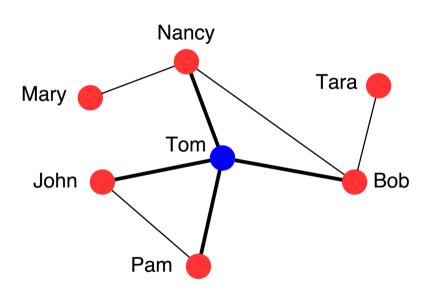

- What is the probability of selecting
 Tom if we select a random node?
- What is the probability of selecting
 Tom if we select a random edge
 and then randomly one of the two
 nodes attached to it?

Sampling a random node vs sampling a random friend of a random node

Average degree of friends

Average degree

$$(1+3+3+1+4+2+2)/7 = 16/7 \approx 2.29$$

- Average degree of friends of:
 - Mary: 3
 - Nancy: (1+4+3)/3 = 8/3
 - Tara: 3
 - Bob: (1+3+4)/3 = 8/3
 - Tom: (3+3+2+2)/4 = 10/4
 - John: (4+2)/2 = 3
 - Pam: (4+2)/2 = 3
 - Average degree of friends ≈ 2.83 (> 2.29)

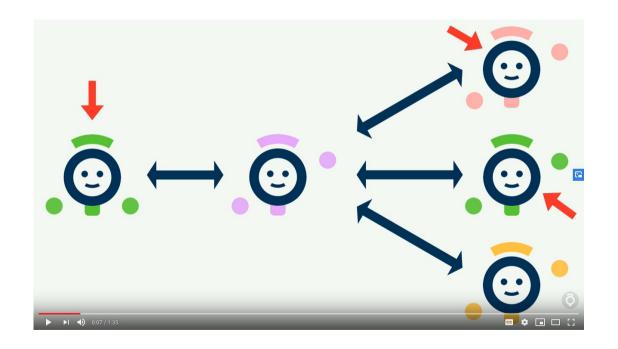

The friendship paradox

- Take a random person x; what is the expected degree of this person? <k>
- Take a random person x, now pick one of x's neighbors, let's say y; what is the expected degree of y?

It is not <k>

- This "paradox" is a useful:
 - As a marketing strategy: if u invites a friend v to buy/use a product, it is likely that v has many friends, and hence it is relevant for marketing that v buys/use the product
 - As a vaccination strategy: instead of offering a vaccine to random people, ask them to name a friend, offer the vaccine to those people, who will have larger degree

Sampling bias and the friendship paradox (1'35")

Imagine you're at a random airport on earth

- Is it more likely to be ...
 a large airport or a small airport?
- If you take a random flight out of it ... will it go to a large airport or a small airport?

An example of friendship paradox

- Pick a random airport on Earth
 - Most likely it will be a small airport
- However, no matter how small it is, it will have flights to big airports
- On average those airports will have much larger degree

Exercise [B. 2016, Ex. 4.10.2]: "Friendship Paradox"

- Random variable K represents the degree of a randomly chosen node; we denoted as p_k the probability that a randomly chosen node has degree k $p_k = Pr(K=k)$
- Random variable K_F will represent the degree of a randomly chosen neighbor ("friend") of a randomly chosen node; we will denote by q_k the probability that a randomly chosen neighbor of a randomly chosen node has degree k $q_k = Pr(K_F = k)$
- The formula is: $q_k = C \ k \ p_k$ where C is a normalization factor (a) Find C (hint: sum of q_k must be 1)

Exercise [B. 2016, Ex. 4.10.2]: "Friendship Paradox"

Random variable K_F is the degree of a randomly chosen neighbor of a randomly chosen node; we denote by q_k the probability that a randomly chosen neighbor of a randomly chosen node has degree k

$$q_k = Pr(K_F = k) = C k p_k$$

(b) Find the expectation $\langle K_F \rangle$

Hints:
$$E[X] = \sum_{x} x \cdot P(X = x)$$
 $E[X^2] = \sum_{x} x^2 \cdot P(X = x)$

Exercise [B. 2016, Ex. 4.10.2]: "Friendship Paradox"

For the scale-free network described below:

- (c) Compute $<\!K_F\!>$: the expected number of friends of a randomly chosen neighbor of a randomly chosen node
- (d) Compare with <k>: the expected number of friends of a randomly chosen node

$$N = 10000$$
 $\gamma = 2.3$
 $k_{\min} = 1$
 $k_{\max} = 1000$

You can use this formula for the **moments** (<k>, <k $^2>$, <k $^3>$, ...) of the degree distribution in a scale-free network:

$$\langle k^n \rangle = (\gamma - 1) k_{\min}^{\gamma - 1} \frac{\left(k_{\max}^{n - \gamma + 1} - k_{\min}^{n - \gamma + 1}\right)}{n - \gamma + 1}$$

? python™

Code

```
def degree moment(kmin, kmax, moment, gamma):
    C = (gamma-1.0)*(kmin**(gamma-1.0))
    numerator = (kmax**(moment-gamma+1.0) - kmin**(moment-gamma+1.0))
    denominator = (moment-gamma+1.0)
    return C * numerator / denominator
kavg = degree moment(kmin=1, kmax=1000, moment=1, gamma=2.3)
print(kavg)
3.787798988222529
ksqavg = degree moment(kmin=1, kmax=1000, moment=2, gamma=2.3)
print(ksqavq)
231.94329076177414
print(ksqavg / kavg)
```

61.23431879119234

Summary

Summary

Your friends have more friends than you

$$\langle k_F \rangle > \langle k \rangle$$

• This can be quite strong in scale-free networks

Practice on your own

• Draw a small graph, and sample from that graph until you're convinced $\langle k_F \rangle > \langle k \rangle$
