Types of centrality measure

- **Non-spectral**

  - Degree

  - Closeness and harmonic closeness

  - Betweenness

- Spectral

  - HITS

  - PageRank

Is u a well-connected person?

- Degree: u has many connections

- **Closeness:** u is close to many people

  – Average distance from u is small

- **Betweenness**: many connections pass through u

  – Large number of shortest paths pass through u

- PageRank: *u is connected to the well-connected*

Closeness

Closeness

- Distance between two nodes is $d(u,v)$

- **Closeness** is the reciprocal of the sum of distances

$$\text{closeness}(u) = \frac{1}{\sum_{v \in V, v \neq u} d(u,v)}$$

- Some graphs are not connected, in that case $d(u,v)$ can be ∞; assuming $1/\infty = 0$ one can define the **harmonic closeness**:
$$\text{hcloseness}(u) = \sum_{v \neq u} \frac{1}{d(u,v)}$$

Exercise

$$\text{closeness}(u) = \frac{1}{\sum_{v \in V, v \neq u} d(u,v)}$$

Compute closeness and harmonic closeness for all the nodes; d(u,v) = 1 if v is a neighbor of u

$$\text{hcloseness}(u) = \sum_{v \in V, v \neq u} \frac{1}{d(u,v)}$$

Summary

Things to remember

- Closeness and harmonic closeness definitions

- Try to compute them on your own on a graph

- Practice drawing examples of graphs in which a chosen node has high degree but low closeness, or viceversa
